Role thinking: Standing in other people's shoes to forecast decisions in conflicts

Kesten C. Green^{a,*}, J. Scott Armstrong^b

^b *The Wharton School, University of Pennsylvania, Philadelphia, PA 19104, USA*

Abstract

When forecasting decisions in conflict situations, experts are often advised to figuratively stand in the other person's shoes. We refer to this as "role thinking", because, in practice, the advice is to think about how other protagonists will view the situation in order to predict their decisions. We tested the effect of role thinking on forecast accuracy. We obtained 101 role-thinking forecasts of the decisions that would be made in nine diverse conflicts from 27 Naval postgraduate students (experts) and 107 role-thinking forecasts from 103 second-year organizational behavior students (novices). The accuracy of the novices' forecasts was 33% and that of the experts' was 31%; both were little different from chance (guessing), which was 28%. The small improvement in accuracy from role-thinking strengthens the finding from earlier research that it is not sufficient to think hard about a situation in order to predict the decisions which groups of people will make when they are in conflict. Instead, it is useful to ask groups of role players to simulate the situation. When groups of novice participants adopted the roles of protagonists in the aforementioned nine conflicts and interacted with each other, their group decisions predicted the actual decisions with an accuracy of 60%.

1. Introduction

We examined the problem of predicting the decisions people will make in important and novel conflict

situations such as occur in politics, war, business, and personal affairs. To date, no statistical or casual models have been found to be feasible for predicting such situations, and thus decision makers must rely on judgmental methods.

Conflict situations are often complex because they involve interactions between two or more parties with divergent interests. The complexity of conflicts

provides fertile ground for hindsight bias. Experts delight in claiming that the proper decisions in conflict situations were obvious and that the actual decisions were misguided (Fischhoff, 1975; Tetlock, 2005).

One possible reason for decisions that appear absurd in retrospect is that people involved in conflicts fail to properly consider the viewpoints of other protagonists. Robert McNamara, head of the US Department of Defense during much of the Vietnam War, drew this conclusion in the documentary *The Fog of War* (Morris, 2003). Experimental evidence shows that roles have a profound influence on people's behavior. Babcock, Loewenstein, Issacharoff, and Camerer (1995) found that research participants who were presented with identical briefing material on a legal dispute made very different estimates of the money settlement a fair judge would hand down, depending on whether they were given the role of lawyer for the defendant or for the claimant. Cyert, March, and Starbuck (1961) found that participants who were given the role of "cost analyst" made substantially different forecasts from those who were given the role of "sales analyst", even though they were given the same data.

One of the lessons McNamara said that he had learned from his involvement in the Vietnam War was that he should have put himself in the shoes of the enemy. Galinsky and Mussweiler (2001) conducted an experiment on "perspective taking" that supports McNamara's belief. Participants in the experiment who thought about an opponent's situation when involved in mock negotiations tended to obtain better outcomes for themselves. Rothbart and Hallmark (1988), however, found in their experiment that participants who were asked to take on the role of either the defense minister or a citizen of one of two imaginary countries involved in a conflict irrationally expected coercive strategies to be effective against the other country, but not against their own. Furthermore, Epley, Keysar, van Boven, and Gilovich (2004), in a series of experiments, found that in assessing the perspectives of others, people tend to anchor on their own perspective, and that their adjustments are incremental and partial even in the presence of incentives to make accurate assessments.

The broad advice to put oneself in the other person's shoes is commonly given to people who deal with conflict situations. For example, Nalebuff and

Brandenburger (1996, p. 52) suggested, "To anticipate other players' reactions to your actions, you have to put yourself in their shoes and imagine how they'll play the game". We call this advice "role-thinking".

Given the potential benefits of following such advice, we investigated an approach to improving judgmental forecasting for conflicts by deriving forecasts from experts' analyses of information about the roles of the protagonists.

2. Comparison of role thinking with unaided judgment and role playing

In designing our research, we followed the multiple hypotheses approach advocated by Chamberlin (1965) and compared the accuracy of plausible alternative methods. The methods we compared were role thinking, unaided judgment, and role playing. Given the uncertainty surrounding the prior research, we expected that our findings would be useful, no matter what they turned out to be.

The most common approach to forecasting decisions in conflict situations is unaided judgment. By unaided, we use the narrow definition of "judgmental procedures unaided by evidence-based forecasting procedures". This definition does not preclude drawing upon knowledge about the situation and other similar situations, and discussing the forecasting problem with other experts.

For the method that is the subject of this research, role thinking, to be useful for forecasting, it would need to outperform unaided judgment. We expected that following the injunction to "put yourself in the other person's shoes" in a structured manner would improve people's ability to predict the decisions made by parties in conflict situations, and we expected that those with more expertise in conflicts would be better able to use role information to derive more accurate forecasts. However, we had reservations as to the extent of any improvement in forecasting accuracy from the use of role thinking. We expected that trying to represent a novel conflict in a realistic way by thinking through the interactions of protagonists with different roles would prove to be difficult. Role thinking would probably result in a cognitive overload, as the possibilities become enormous after only a few exchanges.

We had no expectations about the conditions under which role thinking would be relatively more effective, nor did we have the resources to conduct studies using large numbers of situations in order to assess the effects of different conditions.

We expected that utilizing role information by asking a group of people to each adopt the role of a protagonist and then to interact with others who adopted the roles of the other protagonists would be more realistic — and thus more effective — than asking experts to think hard about the roles and interactions (role thinking). Evidence on the validity of role playing dates back to the 1960s; *Armstrong (2001)* reviewed the evidence. For example, in response to the concern about the effects on subjects of participating in the Milgram experiments on blind obedience in the 1960s, researchers examined whether it might be sufficient to have participants role play as if they were subjects in an experiment. The outcomes of the role-plays matched up closely with the results in six out of seven laboratory experiments. These close matches occurred even though people using their unaided judgment were unable to predict the outcomes of some of these experiments—most notably the Milgram obedience studies themselves (*Milgram, 1974*). *Mixon (1972)*, for example, found that psychology experts, when presented with one of the experimental designs, predicted that about 1% of the subjects would be fully obedient, whereas in the laboratory experiment, 65% were fully obedient. Thus, while we expected that role thinking would be superior to unaided judgment, we expected that role-playing of conflict situations, in the form of the simulated interaction method (*Green, 2005*), would be superior to role thinking.¹

3. Conflict situations for our test

To assess the accuracy of forecasts from role thinking, we employed the nine conflict situations that we have used in our earlier research. The situations are

described briefly in *Table 1*. The research participants were provided with one-to-two page descriptions of the situations and descriptions of the roles of the major protagonists. The numbers of parties and roles that were described for each of the conflicts are indicated in brackets after each conflict name in *Table 1*.

Descriptions of two of the conflicts used in the previous research were prepared as the situations unfolded (55% Pay Plan and Nurses Dispute); that is, the authors did not know what decision would be made when they wrote the descriptions. The other seven conflict situations were obscure and unlikely to be recognized, or were disguised in order to prevent participants from recognizing them. In six instances, participants in our research on role thinking claimed to have recognized the actual situation; those responses were excluded from our analysis.

Eight of the situations involved two protagonists each, and we used two roles to represent each of the two protagonists. By describing two roles per party, the possibility of interactions within a party, as well as between the parties, was suggested to all participants, and was facilitated among the simulated interactions participants. Three situations involved a mediator, and we used a single role for that person. The one situation with nine roles involved a committee without clear parties. All of the role descriptions were short. Here is an example from the Telco Takeover conflict:

Role of expander Telco Chairman—Al Exley

Under your leadership for the past 15 years, telephone company Expander has grown rapidly, with the acquisition of more than 250 companies. Recently, Expander was approached by Localville Telco. Localville wished to explore the possibility of selling its mobile phone business to Expander. You rejected the proposition, as Expander's policy is to be able to offer local telephone services as well as mobile when it moves into a new territory. Localville as a whole, however, would be an attractive acquisition (the companies' territories are complementary) and Expander has offered to buy Localville at a price-per-share that was 40% higher than the price prevailing at the time of the offer. So far, the Localville board has rejected this offer, but you and your son (Expander CEO, Brad Exley) believe Localville is a prize worth fighting for.

¹ The early research on forecasting people's decisions by simulating the situation using interacting role-players used the term "role-playing" to refer to the method. Because the term "role playing" is widely used to refer to various techniques with purposes other than forecasting, we coined the term "simulated interaction" to refer to the forecasting method. The distinctive newer name has the added advantage of reducing the chances of confusion in readers, for example with role thinking.

Table 1
Brief descriptions of conflict situations.

Artists protest (2, 4):	Members of a rich nation's artists' union occupied a major gallery and demanded generous financial support from their government. What will be the final resolution of the artists' sit-in?
Distribution channel (2, 4):	An appliance manufacturer proposed to a supermarket chain a novel arrangement for retailing their wares. Will the management of the supermarket chain agree to the plan?
55% Pay plan (2, 4):	Professional sports players demanded a 55% share of gross revenues and threatened to go on strike if the owners didn't concede. Will there be a strike, and if so, how long will it last?
Journal negotiations] (2, 4):	Editors have asked their journal's publisher for better terms and have received an unfavorable response. What agreement do the parties come to?
Nurses dispute (3, 5):	Angry nurses increased their pay demand and threatened more strike action after specialist nurses and junior doctors received big increases. What will the outcome of their negotiations be?
Personal grievance (3, 5):	An employee demanded a meeting with a mediator when her job was down-graded after an evaluation by her new manager. What will the outcome of the meeting with the mediator be?
Telco takeover (2, 4):	An acquisitive telecommunications provider, after rejecting an offer to buy the mobile business of another, made a hostile bid for the whole corporation. How will the stand-off between the companies be resolved?
Water dispute (3, 5):	Troops from neighboring nations moved to their common border and the downstream nation threatened to bomb a new upstream dam. Will the upstream neighbor agree to release additional water, and if not, how will the downstream nation's government respond?
Zenith investment (2+, 9):	A board committee of a large manufacturer evaluated an investment in expensive new technology in the face of political pressure. How many new manufacturing plants will the corporation decide to commission?

Note: Numbers in brackets are the number of parties, and number of roles.

4. Role thinking method

The research participants, who are described below, were provided with descriptions of some or all of the situations and all of the associated roles. [Appendix A](#) provides the disguised description of one of the situations (Water Dispute) and the associated role descriptions. The actual Water Dispute situation involved two main parties, Syria and Iraq, in a dispute over the waters of the Euphrates River. Saudi Arabian government minister Sheik Yamani became involved in an attempt to avoid war between the two countries. The forecasting problem was to predict whether there would be a decision to go to war or to bomb the dam that was restricting the supply of water to Iraq, or whether more water would be released.

Participants were led through the role-thinking procedure by a questionnaire that we devised for the purpose ([Appendix B](#)). The questionnaires start with a briefing for participants, which states: "A person's role can make a big difference to how he or she views a situation, so it can be difficult to predict what decisions will be made when people interact with each other. In the following table, please indicate which decision you

think each party in the situation just described would prefer to be made and assess how likely it is that each party's preferred decision will actually occur".

Each questionnaire included a list of between three and six decisions that might plausibly have been made in the conflict situation. For example, in the case of the Nurses Dispute, research participants were asked to choose between (a) the nurses' demand for an immediate 7% pay rise and a 1-year term were substantially or entirely met, (b) management's offer of a 5% pay rise and a 2-year term were substantially or entirely accepted, or (c) a compromise was reached.

The questionnaire prompted participants to nominate which of the decisions each party in the conflict would prefer and why, how each party would go about trying to achieve their preferred decision, and the chances out of 10 that each party's preferred decision would be made. Finally, after the participants had completed their analyses, the questionnaire asked them, to state which of the decisions was most likely and why it might and might not occur. The process was intended to encourage participants to think hard

about how the roles of the protagonists would affect their preferences and decisions.

There were two role-thinking sessions. One was at Victoria University of Wellington, New Zealand, in April 2005, and the other was at the Naval Postgraduate School in Monterey, California, in May 2005. Both sessions were conducted during class time, and no incentives were offered for participation.

5. Research participants and their instructions

The participants in the role-thinking session in Wellington were 103 students who were enrolled in a second-year organizational behavior course. The students were shown the following instructions on “Predicting Decisions in Conflict Situations”, and had the balance of 50 minutes of class time to complete the task. In practice, most of the students took approximately 20 to 30 minutes to do so.

1. The research you are about to participate in is part of an investigation into how best to make predictions about the decisions people make in conflicts.
2. In front of you is the description of a real conflict situation. Other participants have descriptions of other situations; there are nine in total. The situations are disguised or obscure, so you are unlikely to recognize the actual situation.
3. Your task is to make judgments about the preferences and decisions of the parties involved in each situation.
4. Please read the description and then answer the questionnaire. Use the reverse side of the questionnaire if you need more space.

The students were mostly about twenty years of age. In order to obtain a measure of their expertise beyond what we could already assume from their youth and undergraduate status, we asked them to rate their specialist experience in conflict management and their experience with conflicts similar to the conflict situation they had been presented with. The median of the students' responses to these questions, using a zero-to-10-scale, was zero for both questions. We refer to these participants as “novices”.

The participants in the role-thinking session at the Naval Postgraduate School at Monterey, CA, were 27 naval postgraduate students in a morning and an

afternoon class, each of two hours in length. They each had copies of the material for one of nine sets of four conflict situations placed face down in front of them, and were given similar instructions to the undergraduate students, except that they were asked to examine four situations and were given 30 minutes for each.

The naval postgraduate students were between 27 and 35 years of age, and thus had in the order of 10 years of experience as adults, compared to none for the undergraduate students. They were navy officers with commensurate responsibilities, and had substantially greater training for and experience with conflict situations than the young New Zealand university undergraduate students. The median of their self-assessed specialist conflict management experience ratings was 4 out of 10, which, when compared to the average zero rating of the undergraduate students, is consistent with the difference in the ages and experience levels of the two groups. The median of the postgraduates' ratings of their experience with *similar* conflicts was 1 (out of 10), which is consistent with them having spent their adult lives as navy officers when the conflict situations used in the research were diverse, with only one (Water Dispute) having martial elements.

While it would have strengthened our findings if we had been able to obtain as participants top experts in the domains of each of the conflicts we used, we did not have the resources to do so. Importantly, however, there is little evidence that top experts are able to perform judgmental tasks better than people with more modest credentials (see, e.g. Armstrong, 1980; Green & Armstrong, 2007a; Tetlock, 2005). With regard to the relevance of the naval postgraduates' levels of expertise for conflicts involving pay negotiations and commercial takeover battles, for example, we suggest that a knowledge of conflicts from one domain may be sufficient to qualify its possessor as an expert, because all of the problems that we gave them involved predicting human behavior in conflict situations.

For the purposes of this research, then, we refer to the naval postgraduate students as “experts”. We expected that if there were any gains in expertise from the use of the role-thinking method, they would show up in a difference between the accuracy of forecasts derived from their analyses and that of those derived

Table 2
Accuracy of role-thinking forecasts vs. unaided judgment and chance percentage accurate (number of forecasts).

Situation	Chance	Unaided judgment ^a				Role thinking			
		Novices		Experts		Novices		Experts

from the young undergraduate organizational behavior students.

6. Findings from the role thinking experiments

We obtained 107 role-thinking forecasts from the novice participants for eight conflict situations, and 101 forecasts from the expert participants for nine conflict situations. The data are available on the Internet.²

The un-weighted average accuracy of the experts' role-thinking forecasts was 31%, which was slightly less accurate than the forecasts of experts who used their unaided judgment, at 32% (Table 2).³ Excluding the Journal Negotiations conflict — for which we

had no experts' unaided judgment forecasts — from the calculations makes no difference to the figures at two significant digits. However, on average for the eight conflicts common to both sets of results (i.e., excluding the Personal Grievance conflict), the novices' role-thinking forecasts were more accurate (at 33%) than the novices' unaided judgment forecasts (at 25%). When novice and expert forecasts are pooled for all nine conflicts, role-thinking forecasts

are relevant to evaluating forecasting methods. With a large enough sample, any difference would be statistically significant, however trivial. In addition, the choice of a null hypothesis is crucial, because significance testers would advocate that it should be adopted when a difference is not statistically significant. In our case we could use any of the competing hypotheses as the null, although, given the evidence to date, simulated interaction would be most appropriate. There are many other reasons for avoiding statistical significance testing (see Armstrong, 2007), with the most important one being that there is no empirical evidence to support the view that such testing can improve decision making, whereas it is easy to show harm (Hauer, 2004; Ziliak & McCloskey, 2008).

² At <http://kestengreen.com/responses—role-thinking.xls>.

³ Statistical significance tests: we do not provide the findings of tests of statistical significance because there is no evidence that they

were somewhat more accurate on average (at 32%) than unaided judgment forecasts (at 27%). Thus, our expectation that the use of a role-thinking procedure would improve judgmental forecasts of decisions in conflicts received little support.

Information on the novices and experts who provided unaided judgment forecasts, including their names, is available from Green and Armstrong (2007a,b). The novices were similar to the novices in the role-thinking experiments (undergraduate students), while the experts were more senior than those in the role-thinking experiments in many cases. Additional information on the participants in the earlier work is available at <http://tinyurl.com/SA-supplementary>.

When forecasts for the one conflict for which novice forecasts were also unavailable (Personal Grievance) are excluded, 30% of the experts' role-thinking forecasts were accurate, compared to 33% of the novices'. This analysis is on the basis of the broad distinction between the expertise of undergraduate students (novices) and that of mature graduate student navy officers (experts). It does not take into account any differences in specialist conflict management experience, or experience with similar conflicts, or the amount of time the participants spent on their analysis. We reasoned that the participating navy officers who had more of such relevant and direct experience should be better able to use the information we provided, and that participants who spent more time on the analysis would also make better use of the information. Next, therefore, we analyzed the effects of prior experience and the time spent on the task for all of the role-thinking responses (novices and experts combined) for each conflict, using participants' answers to our questions about their levels of experience and the time they spent on the task.

The 67 role-thinking forecasts from those with some experience as conflict management specialists (at 33% accurate) were only a little better than the 141 forecasts of those with no experience (at 31% accurate). Experience with conflicts similar to the one being analyzed did help, however; the 102 forecasts of participants with such experience were more accurate than the 102 forecasts of those with no such experience (at 38% accurate compared to 29%).

Spending more time on the role-thinking task was associated with forecasts that were somewhat more

accurate: the 82 forecasts derived from analyses of 25 min or more were somewhat more accurate (at 35%) than the 31% accurate forecasts of the 125 forecasts from the briefer analyses. However, earlier research has found that the forecast accuracy is somewhat negatively related to the amount of time experts spent in deriving their forecasts (Green, 2005).

7. Comparison with forecasts from simulated interaction groups

Armstrong (2001) and Green (2002, 2005) used simulated interaction for the aforementioned conflict situations. In contrast to the role-thinking treatment, the participants in the simulated interaction experiments were given information on their own role only. The participants, who were predominantly undergraduate students, were told to read the role description they had been given, put on a name badge for the role, and adopt the role for the duration of the session. Having adopted their roles, they were instructed to read the situation description.

The participants were instructed to introduce themselves to the other participants while in their roles. They were free to meet and break into smaller groups as often as they considered necessary in order to reach a decision. The simulations typically lasted between 30 and 60 minutes.

Each group's decision was taken as a forecast of the actual protagonists' decisions.

Note that here we are comparing group versus individual forecasts. However, given that the unaided-judgment and role-thinking forecast accuracies differed little from guessing, combining the individual forecasts from these methods would do little to increase accuracy.

The simulated-interaction forecasts were accurate for 60% of the predictions, which was a substantial improvement on the role-thinking forecast accuracy of 32%. The simulated interaction forecasts were more accurate than the role-thinking forecasts for each of the nine conflicts. In addition, when the simulated interaction forecasts were combined across the groups (an average of 14 groups simulated each situation), the modal decision was accurate for eight of the nine conflicts, or 89%.

8. Conclusions and recommendations

Despite being a commonly recommended procedure, there was little prior evidence on whether role thinking can help to predict the decisions of opponents in conflict situations. We conducted experiments and obtained forecasts of the decisions that would be made in nine diverse conflict situations from 103 undergraduate students (107 forecasts) and 27 naval postgraduate students (101 forecasts), who all used a role-thinking method which we devised. Role thinking turned out to be little better than guessing.

We suspect that the poor showing of role thinking is because people are unable to think through complex interactions between protagonists with different roles in ways that realistically represent the situation.

In light of the evidence, there is little support for the use of role thinking. The forecasts are unlikely to be accurate, and decision makers might be lulled into a false sense of confidence that by metaphorically “standing in the other person’s shoes” they know what will happen.

Our findings on role thinking reinforce our findings from previous research: in order to obtain accurate forecasts of the decisions the protagonists will make in a conflict situation, one should ask groups of people to adopt roles and simulate the interactions between the protagonists.

Acknowledgements

We thank Jon Czarnecki for conducting role-thinking sessions with his students at the Naval Postgraduate School, and Hans Hansen for access to his undergraduate students. We also thank Kay A. Armstrong, Michael Beyerlein, Don Esslemont, Baruch Fischhoff, Paul Goodwin, Andreas Graefe, Joe Daly, Nigel Harvey, Philip Schrodt, Bill Zangwill, and three anonymous reviewers for their comments and suggestions, and Soo Lee for her suggestions on the writing.

Appendix A. Example situation description

International water dispute

Today is June 3, 1975. Two poor and arid Asian countries, Midistan and Deltaland, are in dispute over

access to the waters of the River Fluvium. The river rises in Uplandia, whose plentiful rain contributes at least 90% of the flow. It then runs through Midistan, where the scanty rainfall makes up the rest of the flow, and then on through Deltaland to the sea. Relations between the two disputants have deteriorated badly, and the Government of Concordia has stepped in, in an attempt to mediate an agreement. Uplandia is not involved in this dispute.

Background

Both Midistan and Deltaland depend heavily on Fluvium water for irrigation. Midistan also uses the river for generating electricity. Deltaland has exploited the waters of the Fluvium since ancient times. Uplandia and Midistan, on the other hand, started to make substantial use of the river’s water only about ten years ago. Eighteen months ago, Uplandia began filling its new dam at Updama. A few months later, the new Soviet-constructed dam at Mididam in Midistan became operational.

Midistan and Deltaland are ruled by leaders who came to power after military coups. They are loosely aligned to the Soviet Union. Their armed forces are similar in size—both are large and battle-hardened.

Recent developments

On April 7, Deltaland accused Midistan of putting at risk the lives of the three million Deltaland farmers dependent on the water of the Fluvium by diverting excessive volumes from the river. The Deltaland News Agency reported that the protest came “as a result of the lack of response by the Midistani Government to all efforts exerted by the Deltaland Government for years to reach an agreement . . .”. Two days later, the Deltaland Government issued a statement saying that it would take whatever steps were necessary to ensure access to the waters of the Fluvium, and would hold Midistan responsible for any harm to Deltalandish farmers. A congress of Midistani political leaders, on the same day, condemned the Deltaland regime for plotting with enemies of Midistan and betraying the common heritage of the two countries. There were

reports that 200 military and civilian leaders had been arrested in the lead-up to the conference on charges of plotting against the Midistani Government. Those arrested included the director of a news agency and a former director of Midistani television.

The Midistani Government explained their position on the disagreement over access to Fluvium water in an official statement released on April 19. In the statement, Midistan blamed the current crisis on the Deltaland Government's unwillingness to enter in good faith into tripartite negotiations with Midistan and Uplandia for a permanent agreement over sharing the water. Instead, Deltaland had conducted secret negotiations with Uplandia. Midistan claimed to have reached a provisional agreement with Deltaland two years before for the flow of water during the winter just gone, but had stipulated that the agreed volume would have to be revised when the Updama dam began to fill. Midistan accused Deltaland of avoiding negotiations over this issue when Uplandia had commenced filling the Updama dam in January of last year.

The statement also claimed that, despite substantial reductions in, and interruptions of, the flow of water out of Uplandia, Midistan had allowed 70% of the water received to flow on into Deltaland, had released an additional 200 million m³ (0.7% of the usual annual inflow) during the middle of last year in response to a request by Deltaland, and during last winter had let 75% of the water from Uplandia flow on to Deltaland. Further, Midistan accused Deltaland of failing to modernise its irrigation methods in order to make more effective use of the water it does receive.

In response, Deltaland maintained its claims that more water than was required for electricity generation had been withheld and that only half of the water to which Deltaland was entitled had been received.

Claims and counter-claims by Midistan and Deltaland continued through April and May, as did mediation efforts by neighbouring countries, including the wealthy regional leader, Concordia. Midistan accused Deltaland of assassinations and mass executions of dissidents on May 7, and, a week later, closed its airspace to Deltalandish aircraft in response to the mistreatment of Midistani airline personnel employed in Deltaland. On May 25,

Midistan ordered the immediate closure of one of Deltaland's consulates in Midistan. On May 28, a Midistani military official in Deltaland was stabbed, and on May 29, Midistan accused the Deltalandish government of executing 80 government opponents. By June 2, there were reports that both sides had moved troops to the border between the countries and that Deltaland had threatened to bomb the Mididam dam. In response to the deteriorating situation, Concordia renewed its efforts at mediation and a meeting between ministers from the three countries is to be held.

The meeting

Today, Government ministers and officials from Midistan, Deltaland and Concordia will meet to try to resolve the dispute. Those present at the meeting will be a senior Minister from the Kingdom of Concordia and the Foreign Ministers of the Republics of Midistan and Deltaland, each accompanied by a military adviser. A statement will be issued at the end of the meeting. The statement may be one of three alternatives. The gist of these statements is as follows:

- (a) Midistan has decided to release additional water in order to meet the needs of the Deltalandish people;
- (b) Deltaland has ordered the bombing of the dam at Mididam to release water for the needy Deltalandish people; or
- (c) Deltaland has declared war on Midistan.

Role of Republic of Midistan Foreign Minister— Mohammad Fareed

A crisis over access to water is brewing between the poor Asian nation Midistan and the neighbouring Republic of Deltaland. As Midistan's Foreign Minister, you are attending a meeting with your Deltaland counterpart (Daud Fawaz) and a senior Minister from the Kingdom of Concordia—a wealthy regional power. The Minister from Concordia (Karim Khalid) will attempt to mediate an agreement. The crisis has already led to military preparations by both sides. Before joining the meeting you will discuss objectives and strategy with the military adviser who has accompanied you—General Mustafa Ahmad.

As far as you and your government are concerned, Midistan has acted responsibly in a difficult situation

that is not of Midistan's making. You are directly responsible to your President, who, along with you and the rest of the Midistan government, came to power after a military coup.

*Role of Republic of Midistan Military Adviser—
General Mustafa Ahmad*

A crisis over access to water is brewing between the poor Asian nation Midistan and the neighbouring Republic of Deltaland. You are attending a meeting with Deltaland government representatives and a senior Minister from the Kingdom of Concordia—a wealthy regional power. The Minister from Concordia (Karim Khalid) will attempt to mediate an agreement. The crisis has already led to military preparations by both sides—troops have been moved to the vicinity of the common border. Your role is to support and advise your Foreign Minister (Mohammad Fareed), with whom you will discuss objectives and strategy before you both join the meeting.

As far as you and your government are concerned, Midistan has acted responsibly in a difficult situation that is not of Midistan's making. You are directly responsible to your Foreign Minister, who, along with you and the rest of the Midistan government, came to power after a military coup.

*Role of Republic of Deltaland Foreign Minister—
Daud Fawaz*

A crisis over access to water is brewing between the poor Asian nation Deltaland and the neighbouring Republic of Midistan. Deltaland has a long history of using the waters of the River Fluvium and is heavily dependent on the river for both agriculture and drinking water. Midistan has recently built a large dam and the Fluvium's flow into Deltaland has been curtailed. As Deltaland's Foreign Minister, you are attending a meeting with your Midistan counterpart (Mohammad Fareed) and a senior Minister from the Kingdom of Concordia—a wealthy regional power. The Minister from Concordia (Karim Khalid) will attempt to mediate an agreement. The crisis has already led to military preparations by both sides. Before joining the meeting you will discuss objectives and strategy with the military adviser who has accompanied you (General Dirwar Ali).

You are directly responsible to your President, who, along with you and the rest of the Deltaland government, came to power after a military coup.

*Role of Kingdom of Concordia Senior Minister—
Karim Khalid*

Two poor neighbours of the wealthy Kingdom of Concordia appear to be edging closer to war in a dispute over access to the waters of a river that flows from one (Midistan) to the other (Deltaland). Your Kingdom has a traditionally played a paternal role in the region, and has an interest in preserving peace. To that end, you have called a meeting, which is being attended by Midistan and Deltaland representatives, in the hope that your mediation will lead to a peaceful solution to the crisis. Midistan is represented by Foreign Minister Mohammad Fareed and Military Adviser General Mustafa Ahmad. Deltaland is represented by Foreign Minister Daud Fawaz and Military Adviser General Dirwar Ali.

Kesten C. Green (Ph.D., VUW, 2003) has previously published in the *International Journal of Forecasting* and was awarded “Best Paper” for his first paper on forecasting decisions in conflicts. Kesten established the conflictforecasting.com and publicpolicyforecasting.com Internet pages to encourage and disseminate research on these problems. He is also co-director of the forecastingprinciples.com Internet site. Kesten has advised the Department of Defense and the National Security Agency on forecasting, and his work has been covered in the *London Financial Times* and the *Wall Street Journal*.

J. Scott Armstrong (Ph.D., MIT, 1968), Professor of Marketing at the Wharton School, University of Pennsylvania, is the author of *Long-range Forecasting*, the creator of forecastingprinciples.com, and editor of *Principles of Forecasting* (Kluwer, 2001), an evidence-based summary of knowledge on forecasting. He is currently involved with attempts to show how evidence-based approaches can produce more accurate and useful forecasts for: (1) election forecasting, as described on PollyVote.com; (2) climate change forecasting, as described on theclimatebet.com; and (3) terrorism forecasting, as described on conflictforecasting.com. His book, *Persuasive Advertising*, was published in 2010 by Palgrave Macmillan.
